

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

Claims 1-11 (Cancelled)

Claim 12 (New): A method of distributing communications established by radio-communication terminals, within a geographic cell of a radio-communication network, said geographic cell being sub-divided into at least two geographic sectors, the improvement comprising:

rotating an orientation of at least one of said at least two geographic sectors if

a total transmission rate of one of said at least two geographic sectors is

greater than a predetermined total transmission rate, or

a number of links established in one of said at least two geographic sectors is

greater than a predetermined number of links.

Claim 13 (New): The method according to Claim 12, wherein said step of rotating comprises one of:

mechanically rotating at least one of a transmission antennae and a reception antennae associated with said at least one of said at least two geographic sectors; and

reconfiguring a beam of a smart antennae associated with said at least one of said at least two geographic sectors.

Claim 14 (New): The method according to Claim 12, wherein said step of rotating comprises one of:

rotating only if a total transmission rate of at least one of said at least two geographic sectors is less than said predetermined total transmission rate; and

rotating only if a number of links established in at least one of said at least two geographic sectors is less than said predetermined number of links.

Claim 15 (New): The method according to Claim 12, wherein said step of rotating comprises:

A) detecting one or more sectors having one of a total transmission rate greater than a predetermined total transmission rate and a number of established links greater than a predetermined number of links;

selecting one of the one or more sectors in accordance with a predetermined prioritization strategy;

identifying a sector adjacent to said selected sector in accordance with a predetermined selection strategy;

rotating an orientation of a subset of said at least two sectors through a predetermined angle from said selected sector toward said identified adjacent sector so as to create one or more new sectors within said cell; and

detecting at least one of the one or more new sectors satisfying at least one tracking criterion; and repeating said step of rotating an orientation of a subset if no new sector has been detected during said step of detecting at least one of the one or more new sectors, until a new sector is detected.

Claim 16 (New): The method according to Claim 15, wherein

said predetermined prioritization strategy comprises selecting a sector for which at least one of the total transmission rate and the number of established links is the greatest ,

said predetermined selection strategy comprises determining a sector adjacent to said selected sector for which at least one of the total transmission rate and the number of established links is the least, and

said at least one tracking criterion comprises one of

a total transmission rate of a detected new sector is greater than or equal to a total transmission rate of said selected sector, and

a number of links established in said detected new sector is greater than or equal to a number of links established in said selected sector.

Claim 17 (New): The method according to Claim 13, wherein, when said cell is subdivided into three sectors, said rotation step is not implemented if two of said three sectors have at least one of an identical total transmission rate and an identical number of established links.

Claim 18 (New): The method according to Claim 12, wherein said step of rotating comprises:

matching a sector rotation speed to a time for carrying out a transfer of communication from one sector to another.

Claim 19 (New): A device for the distribution of communications established by radio-communication terminals, within a cell of a radio-communications network, comprising:

A1 means for rotating an orientation of sectors in said cell according to any one of steps of Claims 12-18.

Claim 20 (New): A base station for a cell of a radio-communication network, comprising:

means for distributing communications among sectors in a cell according to any one of the steps of Claims 12-18.
